involving circles, both algebraically and geometrically.

Key Concepts and Theorems in Chapter 10

1. Circles and Their Properties

A circle is the set of all points equidistant from a fixed point called the center. Understanding the basic properties of a circle is fundamental:

- The radius is the distance from the center to any point on the circle.
- The diameter is twice the radius and passes through the center.
- The circumference is the perimeter of the circle, calculated as $C = 2\pi r$.

2. Chords, Secants, and Tangents

- Chord: A segment with both endpoints on the circle.
- Secant: A line that intersects the circle at two points.
- Tangent: A line that touches the circle at exactly one point.

Key properties include:

- The perpendicularity of the radius to the tangent at the point of contact.
- The relationship between chords and their distances from the center.

3. Inscribed and Central Angles

- Central angle: An angle with its vertex at the circle's center, intercepting an arc.
- Inscribed angle: An angle with its vertex on the circle, intercepting an arc.

Significant theorems:

- The measure of a central angle equals the measure of its intercepted arc.
- The measure of an inscribed angle is half the measure of its intercepted arc.

4. Arcs and Their Measures

- Major and minor arcs: Parts of the circle between two points, with measures greater than 180° or less.
- The measure of an arc is equal to the measure of its intercepted central angle (for minor arcs).

5. Theorems Related to Circles

- Theorem 10.1: The measure of an inscribed angle is half the measure of its intercepted arc.
- Theorem 10.2: If two chords intersect inside a circle, the products of the segments they form are equal.
- Theorem 10.3: Tangent segments from a common external point are congruent.
- Theorem 10.4: The angles formed outside a circle by two secants are related to the intercepted arcs.
