- a) Copper
- b) Aluminum
- c) Iron
- d) Steel

Answer: a) Copper

- In a simple electrical circuit, the total resistance in series is:

- a) Less than any individual resistance

- b) Equal to the sum of all resistances
- c) Half the resistance of the largest resistor
- d) Zero

Answer: b) Equal to the sum of all resistances

Section B: Short Answer Questions

- Define stress and strain, and explain their significance in materials engineering.

Sample Answer:

Stress is the internal force per unit area within a material arising from external loads, while strain is the deformation or displacement per unit length resulting from stress. Understanding stress and strain helps engineers determine material strength, ductility, and suitability for specific applications.

- Calculate the moment of inertia for a rectangular beam 200 mm wide and 300 mm deep.

Solution:

Moment of inertia, $I = \frac{b d^3}{12}$

Where,

$$b = 200 \text{ mm} = 0.2 \text{ m}$$

$$d = 300 \text{ mm} = 0.3 \text{ m}$$

$$I = \frac{0.2 \times (0.3)^3}{12} = \frac{0.2 \times 0.027}{12} = \frac{0.0054}{12} = 0.00045 \text{ m}^4$$

Section C: Long Answer/Problem-Solving Questions

- A simply supported beam of length 4 m is loaded with a uniformly distributed load of 10 kN/m. Calculate the maximum bending moment and the corresponding bending stress if the beam is made of a material with a bending strength of 150 MPa.

Solution Outline:

- Maximum bending moment, $M_{\max} = \frac{w L^2}{8}$
- $M_{\max} = \frac{10 \times 4^2}{8} = \frac{10 \times 16}{8} = 20$, kNm
- Section modulus, $Z = \frac{I}{c}$, where c is the distance from neutral axis to outer fiber
- Calculate Z using the moment of inertia from previous example
- Bending stress, $\sigma_b = \frac{M}{Z}$

Students are expected to follow through these steps to arrive at the final answer.

Sample Questions and Model Answers

Understanding the types of questions asked can boost confidence. Here are examples inspired by the 2014 April assignment:

Question 1: Describe the process of DNA replication and explain its significance in cell division.

Model Answer: DNA replication is a semi-conservative process where the double helix unwinds, and each strand serves as a template for the formation of a new complementary strand. Enzymes like DNA helicase unwind the DNA, while DNA polymerase adds nucleotides to form new strands. This process ensures that each daughter cell receives an identical copy of genetic information during cell division, which is essential for growth, repair, and reproduction.

Question 2: Explain how natural selection leads to evolution.

Model Answer: Natural selection is a mechanism of evolution where individuals with advantageous traits are more likely to survive and reproduce. Over time, these beneficial traits become more common in the population. This process results in gradual changes in species, allowing them to adapt to their environments and leading to the evolution of new species.

Question 3: Illustrate and label a diagram of a plant cell and describe the function of the chloroplast.

Model Answer: (Include a labeled diagram of a plant cell highlighting the chloroplast.) The chloroplast is the site of photosynthesis, where light energy is converted into chemical energy in the form of glucose. It contains chlorophyll, which absorbs light energy necessary for the process.
