Question 1: Explain the process of photosynthesis.

Answer:

Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose molecules. It primarily occurs in the chloroplasts of plant cells, which contain the pigment chlorophyll. The process can be summarized in two main stages:

- Light-dependent reactions: These occur in the thylakoid membranes and require sunlight. Light energy excites electrons in chlorophyll, leading to the production of ATP and NADPH, and splitting water molecules to release oxygen.
- Light-independent reactions (Calvin Cycle): These take place in the stroma. Using ATP and NADPH from the light-dependent reactions, carbon dioxide is fixed into organic molecules, ultimately producing glucose.

Overall Reaction:

Question 2: Describe the role of enzymes in biological reactions.

Answer:

Enzymes are biological catalysts that speed up chemical reactions in living organisms without being consumed in the process. They lower the activation energy required for reactions to occur, thus increasing the reaction rate. Enzymes are highly specific to their substrates, often binding to them at an active site.

Functions of enzymes include:

- Facilitating digestion by breaking down complex molecules.
- Supporting metabolic pathways.
- Regulating cellular processes.

Factors affecting enzyme activity include temperature, pH, substrate concentration, and inhibitors. Proper enzyme function is vital for maintaining homeostasis and supporting life processes.
