- Precise control over etching depth and profile is vital for device accuracy.

5. Doping (Diffusion and Ion Implantation)

- Doping introduces impurities (such as boron or phosphorus) to modify electrical properties.
- Diffusion involves high-temperature processes, while ion implantation allows precise control over dopant placement.

6. Deposition

- Thin films of metals, insulators, or semiconductors are deposited using techniques like chemical vapor deposition (CVD) or physical vapor deposition (PVD).
- These layers form contacts, interconnects, and dielectric layers.

7. Metallization

- Metal layers (commonly aluminum or copper) are patterned to create electrical interconnections.
- Photolithography and etching define the metal lines and contact pads.

8. Planarization and Passivation
